## Conducting Systematic Reviews: An Introduction

David A. Cook, MD, MHPE

 Forthcoming publication in *Medical Education*

## Why do a systematic review?

Hint: it's NOT a quick path to publication!

Eva: On the limits of systematicity. *Med Educ* 2008.

→ Cook: Narrowing the focus and broadening horizons. *AHSE* 2008

	Systematic / Quantitative	Nonsystematic / Qualitative
<b>Purpose</b>	Summ. lg amt data, confirm hypothesis	Generate novel insights, hypothesis generating
<b>Classic design</b>	Meta-analysis, RCT	Critical synthesis (review), inductive analysis
<b>Selection</b>	Comprehensive, systematic	Purposeful, selective
<b>Inclusion</b>	Similar (homogenous) population, intervention, and outcome	Perceived relevance to question; intentionally seeks dissimilar sources
<b>Analysis</b>	Tests of inference or meta-analysis	Qualitative (narrative)
<b>Data presented</b>	Single number or series of numbers	Rich, critical, insightful narrative
<b>Attribution of differences</b>	Differences are error (heterogeneity)	Differences suggest novel insights
<b>Validity</b>	Large N, homogeneity, lack of bias	Triangulation (concordant multiple sources)
<b>Validity threats</b>	Systematic error (bias) in sampling, heterogeneity	Researcher bias in analysis, failure to triangulate or sample to saturation
<b>Researcher</b>	Impartial, detached	Immersed, interactive

 Cook, AHSE 2008

## The Process

Focused question  
 |----- Write protocol  
 Systematic search  
 |  
 Inclusion / exclusion  
 |  
 Data abstraction  
 |  
 Data analysis

## Focused question

- Population
- Intervention
- Comparison
- Outcome
- Design
  
- Do you have an hypothesis?

## Literature search

- Information sources
  - Database
  - Files, experts
  - Hand search
- Search terms
- Restrictions (time, language, grey)
- Assistance from expert

See: Maggio, Acad Med 2011

## Inclusion / Exclusion

- Defined criteria [operational, examples]
- Ideally, in duplicate
  - Pilot, pilot, pilot
- Two stages
  - Title / abstract (err on inclusion)
  - Full text (consensus “no error”)

## Data abstraction

- P ... I ... C ... O ... D
- Results
- Methodological quality
  - MERSQI (Reed 2007)
  - Newcastle-Ottawa (Cook 2008, 2011)
- Data abstraction form
  - Pilot, pilot, pilot
  - Refine ... **operational** definitions

Document evolution

## Reviewing Tools

- Paper
- Email, IM, teleconf
- Excel
- EndNote
- Google apps: Groups, Docs
- Purpose-built

## Analysis

- **Synthesis**
  - ≠ “litany of the literature”
  - Think of **reader** ... organize, interpret
  - Weaknesses, heterogeneity, gaps
- *Consider* quant. summ (meta-analysis)

What makes a good synthesis?

Focused question

Systematic search

Inclusion / exclusion

Data abstraction

Data analysis

Write protocol

## Hands on practice ... With neighbor →

- What did these authors do at each step?
- What could they have done better?
- Why did they make the decisions they did?
- What questions come to YOUR mind as you reflect on this example?

## Reporting

## PRISMA www.prisma-statement.org

ACADEMIA AND CLINIC | Annals of Internal Medicine  
Preferred Reporting Items for Systematic Reviews and Meta-Analyses:  
The PRISMA Statement

**Abstract.** This is the first systematic description of the PRISMA Statement, an evidence-based reporting guideline for systematic reviews and meta-analyses. The PRISMA Statement is a 27-item checklist of reporting items for systematic reviews and meta-analyses. It is designed to increase transparency and reduce reporting bias. The PRISMA Statement is a living document that will be updated as new evidence emerges.

**Introduction.** The PRISMA Statement is a 27-item checklist of reporting items for systematic reviews and meta-analyses. It is designed to increase transparency and reduce reporting bias. The PRISMA Statement is a living document that will be updated as new evidence emerges.

**Methods.** The PRISMA Statement is a 27-item checklist of reporting items for systematic reviews and meta-analyses. It is designed to increase transparency and reduce reporting bias. The PRISMA Statement is a living document that will be updated as new evidence emerges.

**Results.** The PRISMA Statement is a 27-item checklist of reporting items for systematic reviews and meta-analyses. It is designed to increase transparency and reduce reporting bias. The PRISMA Statement is a living document that will be updated as new evidence emerges.

**Conclusion.** The PRISMA Statement is a 27-item checklist of reporting items for systematic reviews and meta-analyses. It is designed to increase transparency and reduce reporting bias. The PRISMA Statement is a living document that will be updated as new evidence emerges.

Section	Item	Checklist Item	Reporting Item
Abstract	1	Identify the PRISMA Statement as the reporting guideline used for the review.	Abstract
Introduction	2	Provide a rationale for why the review is important and how it addresses a knowledge gap.	Introduction
Methods	3	Identify the PRISMA Statement as the reporting guideline used for the review.	Methods
Results	4	Provide a summary of the results of the review, including the main findings and conclusions.	Results
Conclusion	5	Provide a summary of the conclusions of the review, including the main findings and conclusions.	Conclusion

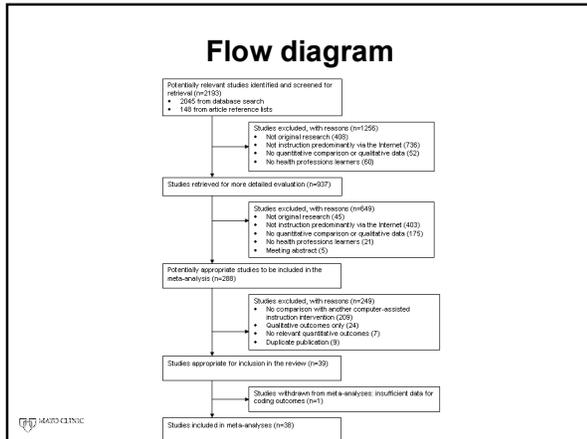

- Be brief
- Highlight previous reviews
  - Limitations → gap

## Methods

- Describe each step of process (separate headings)

## Results

- Trial flow (ref diagram)
- Study characteristics
- Study quality
- Synthesis (\* remember to synthesize \*)
- Tables:
  - 1. List all studies (salient data)
  - 2. Quality of all studies
- Fig: Meta-analysis, themes, framework

### Discussion

- Summary
- Limitations
- Integration with previous reviews
- Implications

MAYO CLINIC

### Abstract

- Background (or Context)
- Question (or Objective)
- Data sources
- Study selection
- Data extraction
- Data synthesis
- Conclusions

MAYO CLINIC

### A taste of meta-analysis

MAYO CLINIC

### Meta-analysis Why?

- Are results similar?
- What is overall best estimate?
- How precise is this estimate?
- Can dissimilarities be explained?

MAYO CLINIC

### Meta-analysis Should I try?

“Statistical tests cannot compensate for lack of common sense, clinical acumen, and biological plausibility”

– Lau 1997

MAYO CLINIC

## Systematic review ≠ meta-analysis

- Can have integrative systematic review
  - “Realist review”
  - Systematic critical review

MEMO CLINIC

## Meta-analysis Estimate effect – common metric

- Binary (pass, death, complication)
  - Odds ratio
- Continuous (score, rating, rate)
  - [standardized] mean difference = “effect size” (Cohen d, Hedges g)
  - r

MEMO CLINIC

## Meta-analysis Estimate common effect

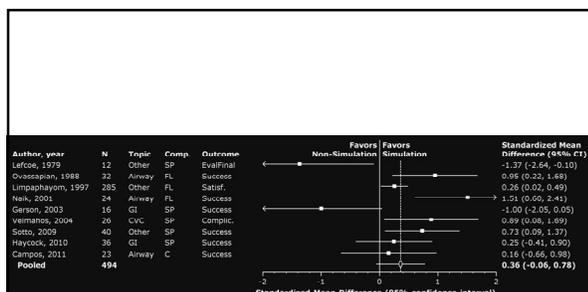

- Fixed effects
  - All variance due to random sampling around “true”
  - (Large sample → error disappears)
- Random effects
  - Some error due to diff. population / context / intervention / outcome
  - (Error persists even with lg sample)

MEMO CLINIC

## Meta-analysis Estimate common effect

- Study weights
  - Function of sample size and ES
  - (*Does NOT include the variance of the individual study*)
- Random effects ADDS between-study variance
- → “Pooled estimate” and CI

MEMO CLINIC

Forest plot: standard (list all studies)

MEMO CLINIC

## Meta-analysis Estimate & explore inconsistency

- Aka heterogeneity
- I<sup>2</sup> (“I squared”): >50% is “high”
  - (also a function of N ... large sample = higher I<sup>2</sup>)
- Explanatory covariates
  - Treatment-subgroup interaction
  - Meta-regression (~ANOVA)

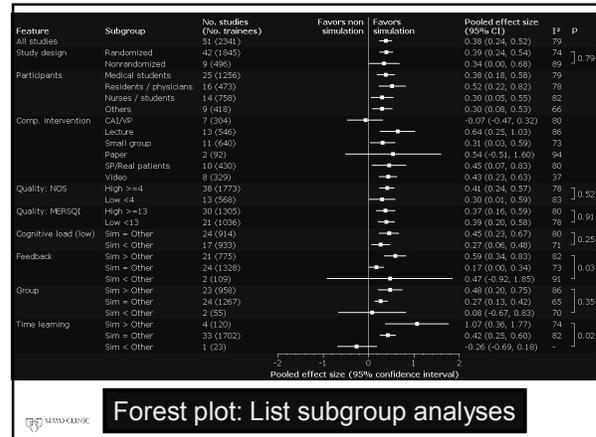

See: Higgins, BMJ 2003

MEMO CLINIC

## Meta-analysis Estimate & explore inconsistency

- Subgroup vs Sensitivity analysis
- Subgroup: classify, analyze in groups
  - 17 studies total, ES = 0.49
  - 9 RCT, ES = 0.31
  - 8 observational, ES = 0.55
  - P=0.02 for difference (interaction)
- Sensitivity: classify, delete (ignore) 1 grp
  - 9 RCT, ES = 0.31

MAYO CLINIC

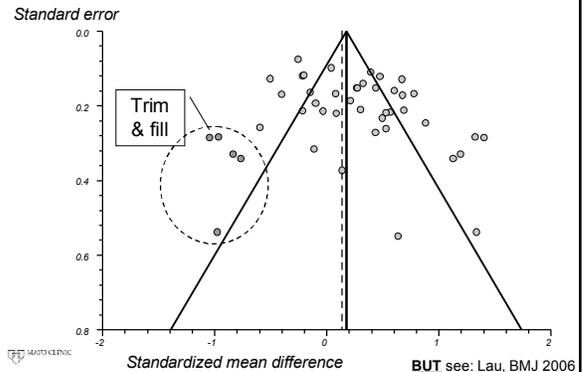

## Meta-analysis Estimate & explore bias

- Study quality (methods)
  - Low-qual → bias? (Cook, Med Educ 2011)
  - Handle it?
    - Subgroup / meta-regression
    - Sensitivity analysis (delete)
- Publication bias (small / neg studies unpublished)
  - Detect? **NO GOOD WAY!** (Funnel plot)
  - Handle it? No good way (trim & fill)

MAYO CLINIC

## Funnel (“bias assessment”) plot

## Meta-analysis in medical education?

- The future is bright ... but still in the future
- We need common
  - Conceptual frameworks
  - Interventions (operational)
  - Outcomes

MAYO CLINIC
